

About Keystone Connect

Keystone Connect is a contractor discovery platform designed to simplify how construction professionals find, evaluate, and organize qualified companies. Built around location-based search and structured construction categories, it enables users to quickly identify relevant contractors, manage results efficiently, and export clean, project-ready data.

At its core, Keystone Connect provides a streamlined workflow: users search by location and trade, refine results using flexible search modes, and curate lists by saving preferred companies or removing irrelevant ones. The platform is designed to reduce noise and surface actionable information, making contractor selection faster and more reliable.

Unlike a traditional directory, Keystone Connect functions as a controlled contractor intelligence tool. It combines external data sources with internal logic for ranking, filtering, and deduplication, ensuring results are both relevant and usable. Features such as radius-based searching, result persistence, and structured exports support real-world project workflows from initial discovery through follow-up.

The platform is built with a focus on stability, scalability, and clarity. Its architecture supports consistent performance across devices, predictable search behavior, and reliable data handling. Keystone Connect is designed to evolve into a centralized system of record for contractor data—maintaining preferred and excluded companies, tracking search activity, and supporting future team-based workflows—while keeping exports as a clean output rather than the source of truth.

Keystone Connect's long-term direction is to enhance project organization, eliminate duplicate effort in contractor searches, and support collaborative workflows across teams. The goal is simple: deliver a tool that is easy to use on the surface, but engineered underneath to support repeatable, high-quality contractor discovery and decision-making.
