

Keystone Connect

Instructions and Functions (Google Places New)

Overview

- Purpose: find commercial contractor businesses by city, ZIP, state, or GPS coordinates using Google Places API (New).
- Business Query menu is hierarchical: selecting a parent runs all child categories, selecting a child runs only that child.
- Results are merged, deduplicated by place ID, scored for relevance, and exportable to CSV.
- Optional website email enrichment can be enabled per search.

How Search Works (Parent/Child)

```
// Parent selection: run all children
if (selection.kind === 'taxonomy') {
  for (const child of selection.selectedChildren) {
    const profile = child.query_profile || {};
    const primaryTerms = (profile.primary_terms || []).filter(Boolean);
    const secondaryTerms = (profile.secondary_terms || []).filter(Boolean);
    for (const term of primaryTerms) pushTextJob({ parent, child, term, profile });
    for (const term of secondaryTerms.slice(0, 2)) pushTextJob({ parent, child, term, profile });
  }
}

// Child selection: selectedChildren contains only one child
// and only that child's query_profile terms are executed.
```

Key Endpoints

- POST /api/search
- GET /api/query-categories
- GET /api/location-suggest
- POST /api/preferred
- POST /api/irrelevant
- POST /api/csv

Run

- Launch from: ui/Open-App.command
- Direct URL: <http://127.0.0.1:8787>
- Required .env key: GOOGLE_MAPS_API_KEY=... (Places API New enabled).

Keystone Connect

Change Log (Start to Current)

Major changes applied across this project timeline:

- Moved from CSV/viewer workflow to a one-click web app flow with integrated search + results.
- Standardized radius handling to miles and set default search radius to 25 miles.
- Unified app launch with Open-App.command and automatic server restart on port 8787.
- Added and corrected brand/logo usage in header and UI shell.
- Reworked UX to reduce debug clutter and present end-user focused result cards.
- Replaced raw website/map URLs in cards with clean labels: website | map.
- Implemented location autocomplete and current-location geolocation support.
- Implemented pop-out/full-size window toggling and state persistence between views.
- Added dark/day mode behavior and normalized cross-platform icon rendering.
- Added custom query dropdown to avoid iOS native oversized menu behavior.
- Implemented parent/child category model: parent triggers all children, child triggers one.
- Added taxonomy-driven backend with query profiles, modifiers, excludes, and priority weights.
- Introduced Places API (New) POST pipeline with required X-Goog-FieldMask handling.
- Implemented search job builder, concurrent runner, retry/backoff, dedupe and relevance ranking.
- Added hard/soft exclusion filtering to reduce irrelevant business matches.
- Added optional website-email enrichment and CSV export integration.
- Added per-search irrelevant-result marking + persistence and undo behavior.
- Added preferred-result starring, storage, and preferred-result retrieval mode.
- Adjusted distance formatting/sorting edge cases (near-zero distances and ordering).
- Normalized dropdown ordering: parents sorted by CSI number, number stripped from display labels.
- Styled parent categories red and indented child categories with bullets.
- Sanitized CSV category_section output to remove mojibake/special-character artifacts.
- Set CSV filename to current search location (sanitized).
- Removed BlueGrid and legacy design assets; retained Keystone-only visual system.
- Removed SCLLR mode, routes, import scripts, and data caches.
- Removed old CLI/test/legacy category files and stale export/background leftovers.
- Simplified package scripts and README to current single-app architecture.
- Added defensive request payload correction for Text Search location bias shape.
- Repositioned watermark and continued shell/background tuning for cleaner presentation.
- Enabled Enter/Return keyboard trigger to run search on desktop and iOS keyboards.
